Basin Outlook Reports And Federal – State – Private Cooperative Snow Surveys

How forecasts are made

Most of the annual streamflow in Arizona originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Measurements of snow water equivalent at selected manual snow courses and automated Snow Telemetry (SNOTEL) sites, along with precipitation and streamflow values, are used in statistical and simulation models to prepare runoff forecasts. These forecasts are coordinated between hydrologists in the Natural Resources Conservation Service (NRCS) the National Weather Service, and the Salt River Project.

Forecasts of any kind are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertainty of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast.

The wider the spread among these values, the more uncertain the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known. This is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or are concerned about having an adequate water supply, they may want to base their decisions on the 90% or 70% exceedance probability forecasts. On the other hand, if users anticipate receiving too much water, or are concerned about the threat of flooding, they may want to base their decisions on the 30% or 10% exceedance probability forecasts. Regardless of the forecast value users choose, they should be prepared to deal with either more or less water.

(Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, D.C., 20250, or call 1-800-245-6340 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.

ARIZONA Basin Outlook Report as of February 1, 2026

SUMMARY

As of February 1, snowpack is well below median throughout the major basins of the state. Precipitation for the month of January was below median to well above median in the major river basins. The Salt and Verde River reservoir system stands at 57 percent of capacity, while San Carlos Reservoir is at 2 percent of capacity. The forecast calls for well below median to above median runoff in the major basins for the spring runoff period.

SNOWPACK

Snow water equivalent in the state's major river basins is well below median, ranging from 16 percent of median in the Verde River Basin to 37 percent of median in the Lower Colorado Mainstem.

PRECIPITATION

Mountain data from NRCS SNOTEL sites and NWS Cooperator gages show that precipitation for January was below median to well above median in the major river basins, while cumulative precipitation since October 1 was below median to well above median throughout the state.

RESERVOIR STORAGE

As of February 1, the Salt and Verde River reservoir system stands at 57 percent of capacity. San Carlos Reservoir is currently at 2 percent of capacity.

Key storage volumes displayed in thousands of acre-feet (x1000):

<u>Reservoir</u>	<u>Current Storage</u>	<u>Last Year Storage</u>	<u>30-Year Median</u>	<u>Storage Capacity</u>
Salt River System	1103.0	1480.8	1157.0	2025.8
Verde River System	204.6	114.9	130.5	287.4
San Carlos Reservoir	19.6	161.6	116.0	875.0
Lyman Lake	3.3	9.5	7.4	30.0
Lake Havasu	558.5	560.3	556.4	619.0
Lake Mohave	1654.0	1655.0	1658.0	1810.0
Lake Mead	8844.0	8923.0	15227.0	26159.0
Lake Powell	6139.7	8275.4	13471.0	24322.0

STREAMFLOW

As of February 1, the forecast calls for well below to above median streamflow for the spring runoff period, ranging from 53 percent of median in the Lower Colorado Mainstem to 111 percent of median in the Verde River Basin. Please refer to the basin forecast tables found in this report for more information regarding water supply forecasts.

SALT RIVER BASIN as of February 1, 2026

Below median streamflow levels are forecast for the basin. In the Salt River, near Roosevelt, the forecast calls for 69% of median streamflow through May, while at Tonto Creek, the forecast calls for 81% of median streamflow through May. Snow survey measurements show the Salt snowpack to be at 18% of median.

Data Current As of: 2/5/2026 1:46:18 PM

SAN FRANCISCO-UPPER GILA RIVER BASIN as of February 1, 2026

Well below median streamflow levels are forecast for the basin. In the San Francisco River, at Clifton, the forecast calls for 60% of median streamflow levels through May. In the Gila River, near Solomon, the forecast calls for 61% of median streamflow levels through May. At San Carlos Reservoir, inflow to the lake is forecast at 64% of median through May. Snow survey measurements show the snowpack for this basin to be at 32% of median.

1) 90% And 10% exceedance probabilities are actually 95% And 5%

2) Forecasts are For unimpaired flows. Actual flow will be dependent On management of upstream reservoirs And diversions
